

Filtration Technology

Technical Data Sheet

The following pages provide an overview of our standard products. However, filters can be modified according to specific needs.

The filters are supplied as standard in the transparent version (see pictures below) with the imprint of the membrane type and the pore size.

If you are interested in special colour codes and imprints or other pore sizes, we will be happy to supply you with a customized solution.

DIAFIL RC Syringe filters

Membrane material: Regenerated cellulose

The membrane of regenerated cellulose is particularly suitable for the filtration of biological solutions due to its low, non-specific absorption characteristics for proteins. A further application area lies in HPLC sample preparation and the degasification of eluents for HPLC (bubble-point on request, depending on the pore size).

The membrane has a high resistance to aqueous and organic HPLC solvents; pH 3-12.

DIAFIL RC is available in various filter diameters and pore sizes, with and without preliminary filter and as a sterile version:

LLF: Luer lock Female (input)

LSM: Luer Slip Male (output)

USV: Ultrasonic-welded housing version

RV: Edge-injected housing version

DIAFIL PA Syringe filters

Membrane material: Polyamide

The polyamide (nylon) membrane is used for the filtration of HPLC and GC solvents, and can also be used for example for the clarification and sterilisation of alkaline solutions.

Nylon membranes are both hydrophilic and resistant to many solvents and alkaline solutions. This membrane also stands out for its high mechanical stability.

DIAFIL PA is available in various filter diameters and pore sizes, with and without preliminary filter and as a sterile version:

Article number	Ø (mm)	Pore size (µm)	Pre-filter	Housing version	Sterile	Connections Input / output

USV: Ultrasonic-welded housing version

RV: Edge-injected housing version

DIAFIL PTFE Syringe preliminary filters

Membrane material: Polytetrafluorethylene

The membrane of polytetrafluorethylene is used for the filtration of aggressive chemicals, including acids and non-aqueous solvents, as well as for GC and HPLC sample preparation. Since it has low flow resistance to gases, the membrane is also used for air and gas filtration (aeration and ventilation tasks).

PTFE membranes are very inert and hydrophobic (but can also be made hydrophilic by wetting with ethanol).

DIAFIL PTFE is available in various filter diameters and pore sizes, with and without preliminary filter and as a sterile version:

Article number	Ø (mm)	Pore size (µm)	Pre-filter	Housing version	Sterile	Connections Input / output

LSM: Luer Slip Male (output)

USV: Ultrasonic-welded housing version

RV: Edge-injected housing version

DIAFIL PVDF Syringe filters

Membrane material: Polyvinylidenfluoride

The polyvinylidenfluoride is used in many applications for biological samples (low protein adsorption) or for pharmaceutical applications. Due to its hydrophilic properties, it is used for clear filtration and sterilisation of aqueous solutions. Because of its chemical compatibility it is less suitable for the filtration of aggressive media such as strong acids, bases and ketones.

DIAFIL PVDF is available in various filter diameters and pore sizes, with and without preliminary filter and as a sterile version:

Article number	Ø (mm)	Pore size (µm)	Pre-filter	Housing version	Ster-ile	Connections Input / output

DIAFIL PP Syringe filters

Membrane material: Polypropylene

Polypropylene membranes are slightly hydrophobic and versatile in use. Apart from strong oxidising agents, they are attacked by few substances, and are therefore relatively inert. The filters can be used for both aqueous and organic media, and have high long-term stability. The flow rates of aqueous solutions are therefore lower than with comparable hydrophilic membranes. Low protein bonding, containing hardly any soluble materials (IC compatible).

DIAFIL PP is available in various filter diameters and pore sizes, with and without preliminary filter and as a sterile version:

Article number	Ø (mm)	Pore size (µm)	Pre-filter	Housing version	Sterile	Connections Input / output

DIAFIL PS Syringe filters

Membrane material: Polyether sulphone

The polyether sulphone membrane is hydrophilic and has a very low protein adsorption. It also has high flow rates in comparison to other membranes. This makes these filters popular products for aqueous or partially organic media (pH range approx. 2-12), e.g. in the area of pharmaceutical and biological sample preparation.

DIAFIL PS is available in various filter diameters and pore sizes, with and without preliminary filter and as a sterile version:

Article number	Ø (mm)	Pore size (µm)	Pre-filter	Housing version	Sterile	Connections Input / output

DIAFIL PE Syringe filters

Membrane material: Polyester

The polyester membrane is a hydrophilic membrane. It can be used for both aqueous and organic solvents (or mixtures of the two). It is therefore much used in HPLC sample preparation. The membrane is not cytotoxic.

DIAFIL PE is available in various filter diameters and pore sizes, with and without preliminary filter and as a sterile version:

Article number	Ø (mm)	Pore size (µm)	Pre-filter	Housing version	Sterile	Connections Input / output
FPE150020	15	0,2	-	USV	-	LLF / LSM

DIAFIL CM Syringe filters

Membrane material: Mixed cellulose ester

The mixed cellulose ester membrane is a hydrophilic membrane with similar properties to the CA or CN membranes, since it consists of a mixed ester of the two. The properties of one component or the other predominates, depending on the mixing ratio. The filters supplied by us contain a high proportion of cellulose nitrate, and can therefore be used for similar tasks.

DIAFIL CM is available in various filter diameters and pore sizes, with and without preliminary filter and as a sterile version:

Article number	Ø (mm)	Pore size (µm)	Pre-filter	Housing version	Sterile	Connections Input / output

LLF: Luer lock Female (input)

LSM: Luer Slip Male (output)

USV: Ultrasonic-welded housing version

RV: Edge-injected housing version

DIAFIL CN Syringe filters

Membrane material: Cellulose nitrate

The cellulose nitrate membrane is hydrophilic and is therefore much used in microbiological investigations, because it has a high, non-specific adsorption capability for biological components (bacteria, yeasts...). The filters are therefore ideally suitable for separating such compounds out of the solution. The filters can alternatively be used for sample preparation of aqueous media.

DIAFIL CN is available in various filter diameters and pore sizes, with and without preliminary filter and as a sterile version:

Article number	Ø (mm)	Pore size (µm)	Pre-filter	Housing version	Sterile	Connections Input / output
FCN250020R	25	0,2	-	RV	-	LLF / LSM
FCN250045R		0,45	-	RV	-	LLF / LSM

LLF: Luer lock Female (input)

LSM: Luer Slip Male (output)

USV: Ultrasonic-welded housing version

RV: Edge-injected housing version

DIAFIL CA Syringe filters

Membrane material: Cellulose acetate

The cellulose acetate membrane is hydrophilic. Due to its low protein adsorption, filters with this membrane are frequently used for biological samples (e.g. enzyme solutions, biological macro-molecules). Other applications include the clear filtration and sterile filtration of aqueous solutions. The membrane also has high temperature stability.

DIAFIL CA is available in various filter diameters and pore sizes, with and without preliminary filter and as a sterile version:

Article number	Ø (mm)	Pore size (µm)	Pre-filter	Housing version	Sterile	Connections Input / output
FCA150020	15	0,2	-	USV	-	LLF / LSM

DIAFIL GF Syringe filters

Membrane material: Fibreglass fleece

Fibreglass fleece is used for preliminary filtration or filtration of media difficult to filter. The three-dimensional filter surface provides a much greater intake capacity for contaminating particles than is the case with two-dimensional membranes. The fibreglass is inert to solvents, acids and bases.

DIAFIL GF Vorfilter is available in various filter diameters and pore sizes, with and without preliminary filter and as a sterile version:

Article number	Ø (mm)	Pore size (µm)	Pre-filter	Housing version	Sterile	Connections Input / output
FGF150001	15	0,2	-	USV	-	LLF / LSM
FGF140001		0,2	-	USV	-	LLF / Mini-Tip
FGF150001S		0,2	-	USV	yes	LLF / LSM
FGF140001S		0,2	-	USV	yes	LLF / Mini
FGF250001	25	0,2	-	USV	-	LLF / LSM

DIAFIL Inline-Filter 50 mm

The 50 mm inline-filter with ultra-pure polypropylene housing (ultrasonic welded) is designed to contain one or multiple 47 mm membrane cycles. The filter comes with 6-12 mm tube clips (tapered) at the inlet and outlet side.

Depending on the application, the filter can be customized with different membrane types.

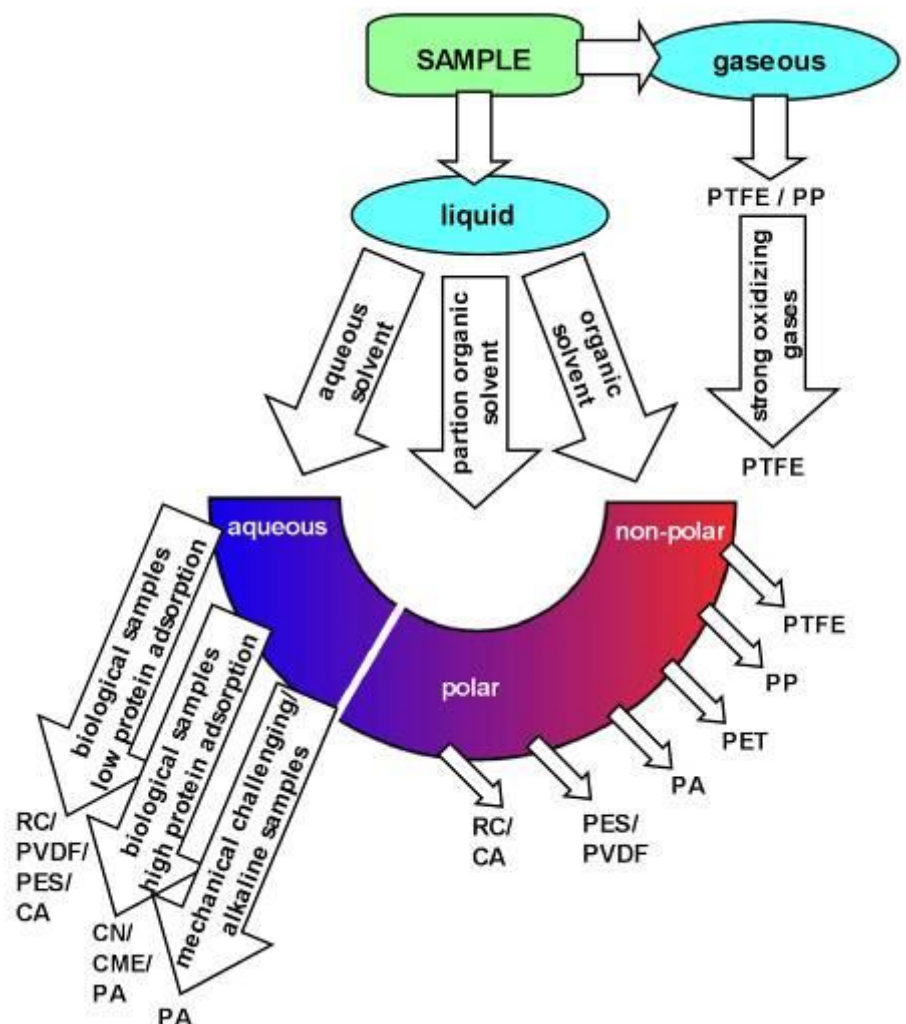

Due to its large filter area of 1735 mm², the filter is suitable for long term gas filtration and venting applications, but also for the filtration of higher volumes of liquid up to approx. 500 ml, depending on the particle load of the filtrated suspension.

Quick application guide

Not every filter is suitable for all applications. Thanks to the following overview, you can make a preliminary selection of the membrane type.

Filters with different diameters and pore sizes for special uses can be supplied on request.

Instructions on the handling of syringe filters

The following overview will give you information on special features when using different pore sizes.

1. Properties of filters in relation to the pore size:

Cleaning operation	Pore size to be used (µm)
Sterile filtration	0,2
Thorough cleaning	0,45
Clear filtration (freedom from particles)	1-2
Preliminary filtration	5,0

The following table gives you an overview of the approximate volume of liquid that can be made flow through a membrane according to its diameter. Greater deviations from the specified average value may occur depending on the particle charging of the liquid.

2. Relationship of filterable sample quantities to the filter diameter:

Filter diameter (mm)	Sample quantity (ml)
4	<1
13	1-10
25	10-100
30	>100 (or fast filtration)

The specified values are approximate values

In the case of solutions that are difficult to filter, high pressure may be necessary to make the liquid flow through the filter. The following table estimates the pressures required and determines the corresponding filters.

3. Manually generated maximum pressure in relation to syringe volume

Syringe volume (ml)	Pressure (bar / psi)
1	10 / 150
3	7 / 100
5	5 / 75
10	3,5 / 50
20	2 / 30

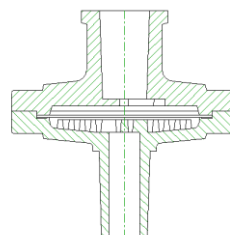

The bar/psi conversion has been rounded

Technical specifications of syringe filters

Specifications of the syringe preliminary filter with:

15 mm diameter (ultrasonic-welded):

Housing material:	Polypropylene
Total filter volume:	0,335 ml
Dead volume:	< 25 μ l
Filter area:	177 mm ²
Max. operating pressure:	9 bar
Inlet:	Luer-Lock (female)
Outlet:	Luer-Slip (male)

15 mm diameter Mini-Tip (ultrasonic-welded):

Housing material:	Polypropylene
Total filter volume:	0,335 ml
Dead volume:	< 25 μ l
Filter area:	177 mm ²
Max. operating pressure:	9 bar
Inlet:	Luer-Lock (female)
Outlet:	Mini-Tip

25 mm diameter (ultrasonic-welded):

Housing material:	Polypropylene
Total filter volume:	0,6 ml
Dead volume:	< 65 μ l
Filter area:	490 mm ²
Max. operating pressure:	6 bar
Inlet:	Luer-Lock (female)
Outlet:	Luer-Slip (male)

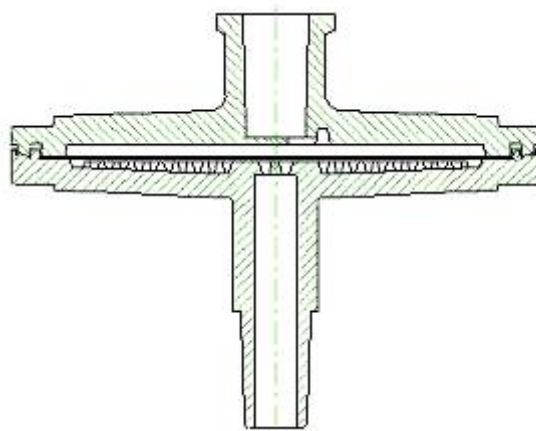

25 mm diameter (edge-injected):

Housing material:	Polypropylene
Total filter volume:	0,6 ml
Dead volume:	< 65 μ l
Filter area:	490 mm ²
Max. operating pressure:	8 bar
Inlet:	Luer-Lock (female)
Outlet:	Luer-Slip (male)

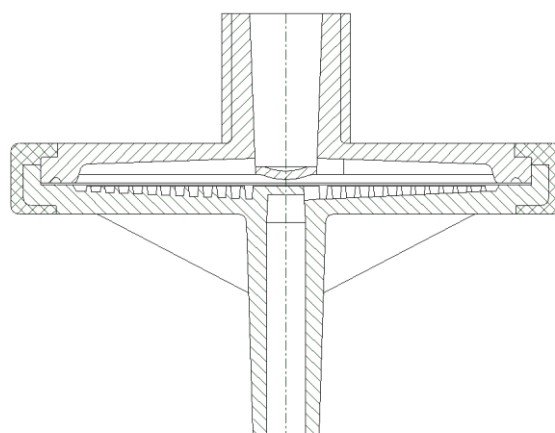

30 mm diameter (ultrasonic-welded):

Housing material:	Polypropylene
Total filter volume:	0,864 ml
Dead volume:	< 170 μ l
Filter area:	707 mm ²
Max. operating pressure:	6 bar
Inlet:	Luer-Lock (female)
Outlet:	Luer-Slip (male)

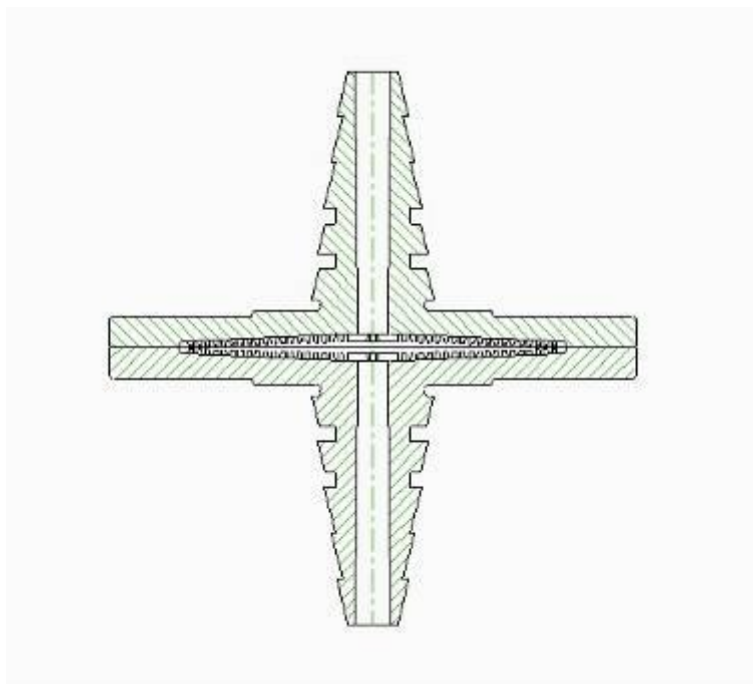

30 mm diameter (edge-injected):

Housing material:	Polycarbonate
Total filter volume:	0,864 ml
Dead volume:	< 170 μ l
Filter area:	707 mm ²
Max. operating pressure:	8 bar
Inlet:	Luer-Lock (female)
Outlet:	Luer-Slip (male)

50 mm Diameter Inline Filter

Housing material:	Polypropylene
Total filter volume:	2,57 ml
Dead volume:	< 920 µl
Filter area:	1735 mm ²
Max. operating pressure:	4 bar
Inlet:	Tube clip 6-12 mm
Outlet:	Tube clip 6-12 mm

Customized filters

Should you require particular pore sizes (0,1 – 200 µm) for your application, we will be happy to help.

Filters can be customized in terms of:

- imprint
- colour coding
- coloured edge
- diameter (approx. size range 4 – 70 mm)
- pore size (0,1 – 200 µm)
- membrane material (CA, CN, CME, PES, PET, PP, PC, ACP, PE, stainless steel etc.)
- connection

Samples

Send us an e-mail with the article number shown in the list of filter types and we will send you some samples (5-15 pcs. as required) for test purposes.

Alternatively, you can request our sample case with a representative selection
